## iVMS-4200 Methods of Playback

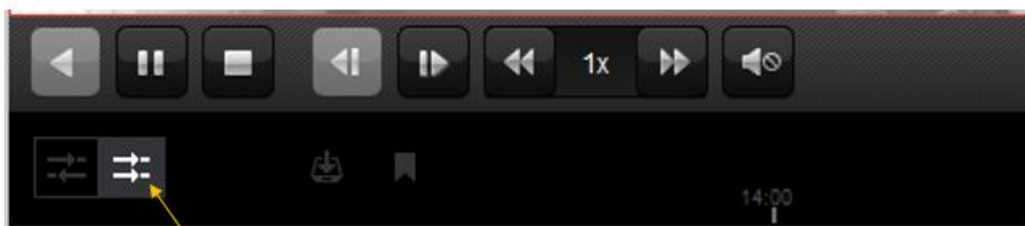

---

On the iVMS software there are two methods of playback, synchronous and asynchronous.

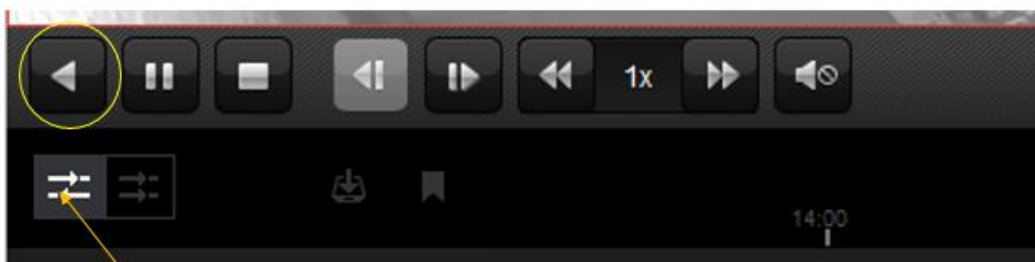

Synchronous playback allows you to playback a number of cameras in sync at the same time, however, it doesn't give you the option to "Reverse Play" with this method.

Alternatively, the other method of playback is asynchronous. The asynchronous method allows you to "Reverse Play" however when you are playing back a number of cameras they are NOT in sync.

Please see the pictures below showing you how to change from synchronous to asynchronous and vice versa on the iVMS 4200 software.

Synchronous Playback

Asynchronous Playback
